

Beyond Barriers: Overcome EHR interoperability challenges with Pharmetika

The pressure on our industry to innovate and control costs has never been greater. Value-based payment models will reshape nearly every

aspect of healthcare as we know it. In order to succeed, there are 3 primary obstacles we need to overcome: data, communication, and collaboration. Our platform takes on each.

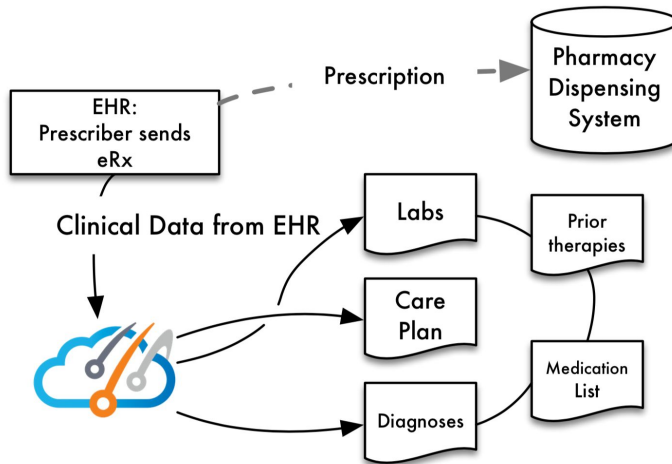

Clinical Exchange Solutions:

[enabling collaboration, reducing speed-to-therapy, and more]

Clinical exchange capabilities are integrated into existing EHR systems and provider workflows.

Pharmetika harnesses that power and brings it to the pharmacy world so clinical pharmacists can

seamlessly send and receive information where and when they need it most, without taking time or attention away from their patients. Bi-directional support means pharmacists can even share back into the EHR opening the door to collaborative practice arrangements.

> Integrated into your workflow

Transitions of care: discharge summaries providing the context of care are transmitted when an eRx is sent.

Specialty Intake: receive labs, diagnoses, care plan, and prior therapies alongside the prescription

Prescriber Notification: provide updates to the prescriber as the prescription moves through the prior authorization process
